# Problem Definition

- Let a graph  $G = (V, E)$ , be defined by its vertex  $V = \{1, 2, \dots, n\}$  and edges  $E = \{(i_1, j_1), (i_2, j_2), \dots, (i_m, j_m)\}$  sets, with  $|V| = n$  and  $|E| = m$ .

Figure: 1

# Problem Definition

- Let a graph  $G = (V, E)$ , be defined by its vertex  $V = \{1, 2, \dots, n\}$  and edges  $E = \{(i_1, j_1), (i_2, j_2), \dots, (i_m, j_m)\}$  sets, with  $|V| = n$  and  $|E| = m$ .
- Lexicographic Depth-First Search (DFS) traversal problem requires computation of parent information, pre-order (start time) and post-order (end time) for every node in  $G$ .

Figure: 1

|            |   |                                |
|------------|---|--------------------------------|
| node       | = | $\{a, b, c, d, e, f\}$         |
| pre-order  | = | $\{0, 1, 4, 5, 2, 3\}$         |
| post-order | = | $\{5, 2, 4, 3, 1, 0\}$         |
| parent     | = | $\{\emptyset, a, a, c, b, e\}$ |

# Problem Subdivisions

## Pre-Order and Post-Order Time

### Definition 1

Let  $\varsigma_p$  and  $\zeta_p$  denote the number of nodes reachable under and including node  $p$ , where if a sub-graph is reachable from  $k$  multiple parents then its nodes are counted once and  $k$  times, respectively.

- For example, in Fig. 1 we have  $\zeta_a = 7$  and  $\varsigma_a = 6$ , because we double counted the node  $f$  in the former case.

# Problem Subdivisions

## Pre-Order and Post-Order Time

### Definition 1

Let  $\varsigma_p$  and  $\zeta_p$  denote the number of nodes reachable under and including node  $p$ , where if a sub-graph is reachable from  $k$  multiple parents then its nodes are counted once and  $k$  times, respectively.

- For example, in Fig. 1 we have  $\zeta_a = 7$  and  $\varsigma_a = 6$ , because we double counted the node  $f$  in the former case.
- Also, notice the recursive relationship :

$$\zeta_p = 1 + \sum_{i \in C_p} \zeta_i$$

where  $C_p$  is ordered set of children of  $p$ .

# Problem Subdivision

## Pre-Order and Post-Order Time

### Definition 2

Let  $\tilde{\zeta}_l$  where  $l$  is an index of exclusive prefix sum list, of the list  $\zeta_i$ , where  $i \in C_p$ .

$$\tilde{\zeta}_l = \sum_{i < l, i \in C_p} \zeta_i$$

- For example, in Fig. 1 we have  $\tilde{\zeta}_b = 0$  and  $\tilde{\zeta}_c = 3$ .

### Definition 3

Let us define a directed tree (DT) to be a DAG, where every node has a single parent.

# Problem Subdivision

## Pre-Order and Post-Order Time

---

**Algorithm** Sub-Graph Size (bottom-up traversal)

---

```
1: Initialize all sub-graph sizes to 0.
2: Find leafs and insert them into queue  $Q$ .
3: while  $Q \neq \{\emptyset\}$  do
4:   for node  $i \in Q$  do in parallel
5:     Let  $P_i$  be a set of parents of  $i$  and queue  $C = \{\emptyset\}$ 
6:     for node  $p \in P_i$  do in parallel
7:       Mark  $p$  outgoing edge  $(p, i)$  as visited
8:       Insert  $p$  into  $C$  if all outgoing edges are visited
9:     end for
10:  end for
11:  for node  $p \in C$  do in parallel
12:    Let  $C_p$  be an ordered set of children of node  $p$ 
13:    Compute a prefix-sum on  $C_p$ , obtaining  $\zeta_p$ 
      (use lexicographic ordering of elements in  $C_p$ )
14:  end for
15:  Set queue  $Q = C$  for the next iteration
16: end while
```

---

# Problem Subdivision

## Pre-Order and Post-Order Time

- Notice that for DT, the sub-graph size at node  $p = \zeta_p$ .

# Problem Subdivision

## Pre-Order and Post-Order Time

- Notice that for DT, the sub-graph size at node  $p = \zeta_p$ .

### Definition 4

Let a path from root  $r$  to node  $p$  be an ordered set of nodes  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$ , where  $k$  is the depth of the node  $p$ .

# Problem Subdivision

## Pre-Order and Post-Order Time

- Notice that for DT, the sub-graph size at node  $p = \zeta_p$ .

### Definition 4

Let a path from root  $r$  to node  $p$  be an ordered set of nodes  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$ , where  $k$  is the depth of the node  $p$ .

### Theorem

Let  $\zeta_i$  be the sub-graph size for node  $i$  in a DT and  $\tilde{\zeta}_i$  be the corresponding prefix-sum value. Then,

$$preorder(p) = k + \tau_p \quad (1)$$

$$postorder(p) = (\zeta_p - 1) + \tau_p \quad (2)$$

where  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$  and,  $\tau_p = \sum_{l \in \mathfrak{P}_{r,p}} \zeta_l$

# Problem Subdivision

## Pre-Order and Post-Order Time

---

**Algorithm** Pre- and Post-Order (top-down traversal)

---

```
1: Initialize pre and post-order of every node to 0.
2: Find roots and insert them into queue  $Q$ .
3: while  $Q \neq \{\emptyset\}$  do
4:   for node  $p \in Q$  do in parallel
5:     Let  $\text{pre} = \text{pre-order}(p)$ 
6:     Let  $\text{post} = \text{post-order}(p)$ 
7:     Let  $C_p$  be a set of children of  $p$  and queue  $P = \{\emptyset\}$ 
8:     for node  $i \in C_p$  do in parallel
9:       Set  $\text{pre-order}(i) = \text{pre} + \tilde{\zeta}_i$ 
10:      Set  $\text{post-order}(i) = \text{post} + \tilde{\zeta}_i$ 
11:      Mark  $i$  incoming edge  $(p, i)$  as visited
12:      Insert  $i$  into  $P$  if all incoming edges are visited
13:   end for
14:   Set  $\text{pre-order}(p) = \text{pre} + \text{depth}(p)$ 
15:   Set  $\text{post-order}(p) = \text{post} + \zeta_p$ 
16: end for
17: Set queue  $Q = P$  for the next iteration
18: end while
```

## DAG to Directed Tree

### Definition 5

Let  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$  and  $\mathfrak{Q}_{r,p} = \{r, j_1, j_2, \dots, j_{k-1}, p\}$  be two paths of potentially different length to node  $p$ . We say that path  $\mathfrak{P}$  has the first lexicographically smallest node and denote it by

$$\mathfrak{P}_{r,p} < \mathfrak{Q}_{r,p} \quad (3)$$

when during the pair-wise comparison of the elements in the two paths going from left-to-right the path  $\mathfrak{P}_{r,p}$  has the lexicographically smallest element in the first mismatch.

# Problem Subdivision

## DAG to Directed Tree

### Definition 5

Let  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$  and  $\mathfrak{Q}_{r,p} = \{r, j_1, j_2, \dots, j_{k-1}, p\}$  be two paths of potentially different length to node  $p$ . We say that path  $\mathfrak{P}$  has the first lexicographically smallest node and denote it by

$$\mathfrak{P}_{r,p} < \mathfrak{Q}_{r,p} \quad (3)$$

when during the pair-wise comparison of the elements in the two paths going from left-to-right the path  $\mathfrak{P}_{r,p}$  has the lexicographically smallest element in the first mismatch.

For example, in Fig. 1 the two paths to node  $f$  are

$$\mathfrak{P}_{r,p} = [a, b, e, f]$$

$$\mathfrak{Q}_{r,p} = [a, c, d, f]$$

# Problem Subdivision

## DAG to Directed Tree

### Theorem

*Let  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$  and  $\mathfrak{Q}_{r,p} = \{r, j_1, j_2, \dots, j_{k-1}, p\}$  be two paths of potentially different length to node  $p$ . If  $\mathfrak{P}_{r,p} < \mathfrak{Q}_{r,p}$  then  $\mathfrak{P}_{r,p}$  is the path taken by DFS traversal.*

# Problem Subdivision

## DAG to Directed Tree

### Theorem

*Let  $\mathfrak{P}_{r,p} = \{r, i_1, i_2, \dots, i_{k-1}, p\}$  and  $\mathfrak{Q}_{r,p} = \{r, j_1, j_2, \dots, j_{k-1}, p\}$  be two paths of potentially different length to node  $p$ . If  $\mathfrak{P}_{r,p} < \mathfrak{Q}_{r,p}$  then  $\mathfrak{P}_{r,p}$  is the path taken by DFS traversal.*

### Corollary

Let  $\mathfrak{G}$  be the set of all paths from root  $r$  to node  $p$ . The DFS traversal takes

$$\mathfrak{P}_{r,p} = \min_{\mathfrak{Q}_{r,p} \in \mathfrak{G}} \mathfrak{Q}_{r,p} \quad (4)$$

# Problem Subdivision

## DAG to Directed Tree

---

**Algorithm**    Compute DFS-Parent by Comparing Path (top-down traversal)

---

```
1: Initialize path to  $\{\emptyset\}$  and parent to  $-1$  for every node.
2: Find roots and insert them into queue  $Q$ .
3: while  $Q \neq \{\emptyset\}$  do
4:   for node  $p \in Q$  do in parallel
5:     Let  $C_p$  be a set of children of  $p$  and queue  $P = \{\emptyset\}$ 
6:     for node  $i \in C_p$  do in parallel
7:       Let the existing path be  $\Omega_{r,i}$ 
8:       Let the new path be  $\mathfrak{P}_{r,i}$ 
          ( $\mathfrak{P}_{r,i}$  is a concatenation of path to  $p$  & node  $i$ )
9:       if  $\mathfrak{P}_{r,i} \leq \Omega_{r,i}$  then
10:        Set  $\Omega_{r,i} = \mathfrak{P}_{r,i}$ 
11:        Set  $\text{parent}(i) = p$ 
12:       end if
13:       Mark  $i$  incoming edge  $(p, i)$  as visited
14:       Insert  $i$  into  $P$  if all incoming edges are visited
15:     end for
16:   end for
17:   Set queue  $Q = P$  for the next iteration
18: end while
```

---

# Outline

- 6 Deliverables

# Analysis of the Problem

The aforementioned parallel algorithm to compute the DFS traversal of a DAG is work-efficient.

- Parallel prefix-sum can be computed in  $O(\log n)$ , by doing  $O(n)$  work.
- The parallel sorting can be computed in  $O(\log n)$ , by doing  $O(n \log n)$  work.

# Analysis of the Problem

The aforementioned parallel algorithm to compute the DFS traversal of a DAG is work-efficient.

- Parallel prefix-sum can be computed in  $O(\log n)$ , by doing  $O(n)$  work.
- The parallel sorting can be computed in  $O(\log n)$ , by doing  $O(n \log n)$  work.

## Lemma 1

Let  $n = \min(n_1, n_2)$ , then identifying the first left-to-right pair of digits in two sequences of  $n_1$  and  $n_2$  numbers can be performed in  $O(\log n)$  steps, by doing  $O(n)$  work.

# Analysis of the Problem

## Lemma 1

Let  $n = \min(n_1, n_2)$ , then identifying the first left-to-right pair of digits in two sequences of  $n_1$  and  $n_2$  numbers can be performed in  $O(\log n)$  steps, by doing  $O(n)$  work.

## Lemma 2

The queue can be implemented such that parallel insertion and extraction of  $n$  numbers, can be performed in  $O(\log n)$  and  $O(1)$  steps, respectively. Also, the algorithm performs  $O(n)$  work.

# Analysis of the Problem

## Theorem

*Alg.2 takes  $O(\eta(\log d + \log k))$  steps and performs  $O(m + n)$  total work to traverse a DAG. The number of processors  $t \leq m + n$  actively doing work varies at each step of the algorithm. Here  $\eta$  is the length of longest path in DAG,  $d$  is maximum degree in DAG and  $k$  is the maximum number of elements inserted into a queue.*
